

## AIR COMPRESSOR UPGRADE

SeedMaster is announcing a large style Air Compressor Upgrade Kit. The large style PACBRAKE air compressor is setup with heavier wiring, replaceable air filters and sensors to better monitor zone command air pressure. The Air Compressor Upgrade kit Part#- (408880) is for 2011 - 2014 SeedMaster Tank models.

Operators should regularly service and maintain their zone command air system and filters, which are equipped with air pressure sensors and gauges to monitor the air filter life, and zone command air pressure. The zone command air pressure is also equipped to alarm if air system is not properly pressured. These alarms should be left active.

All units operating the PACBRAKE compressor should also inspect their air system including air filters, lines, sensors, and overall operation. On SM16 models the main pressure charge line has also been changed from a copper line to a Teflon tube. This line is more forgiving to vibration and maintains a proper sealed air system. Please contact your SeedMaster Certified Dealer for model specific pricing and availability.

We thank you for maintaining your SeedMaster equipment. If you have any questions, please contact your SeedMaster Certified Dealer directly.
